

From programmable datapath to explicit memory and control contracts (2011–2026)

Linux networking milestones by architecture axis, set against the four architecture eras and X.0 releases

Legend ○ --- ● approx. development start → first canonical release ● successive milestones architecture era X.0 release lineage: release that a later feature builds on development began before 2011

• First canonical release in Part VI; a feature keeps evolving after it. 7.3-rc = merged to mainline on 2026-08-20, final 7.3 pending.

• Eras follow Part II: they are set by the dominant design problem, overlap, and are not X.0 boundaries.

• Rows are grouped by architecture axis. Cross-cutting domains (e.g. BBR, MPTCP, kTLS) and netmem / memory providers (provenance still open) have no row.
